

Diesel controversy –Temporary shock or paradigm shift in powertrain?

Impact of the diesel controversy on OEMs and suppliers

Executive summary

- > European OEMs have utilized the fuel-efficient diesel powertrain as a key lever to reduce corporate fleet CO₂ emissions, especially in the EU due to 2020/21 CO₂ vehicle emission targets. These targets are basically impossible to reach without diesel
- > We therefore expect diesel to remain a key pillar in OEMs' powertrain strategies, especially in Europe
- > The current debate about diesel will, however, further drive innovations in combustion¹⁾ and after-treatment of diesel due to increasing regulatory requirements and standards, and will enforce test cycle implementation aiming to reflect Real Driving Emissions (RDE)
- In order to fulfill RDE regulations, diesel will become cleaner (with emission levels similar to gasoline engines), but also more expensive
- > The resulting cost increase will **accelerate the substitution** process from diesel to smaller gasoline engines, especially in lower vehicle segments. Diesel will still remain dominant in the upper vehicle segments but total diesel share in Europe will decline in the coming years
- > OEMs therefore have to further accelerate alternative powertrain solutions. Suppliers have the opportunity to implement innovative solutions for the further control of diesel RDE, and should also step up their preparations for alternative powertrains

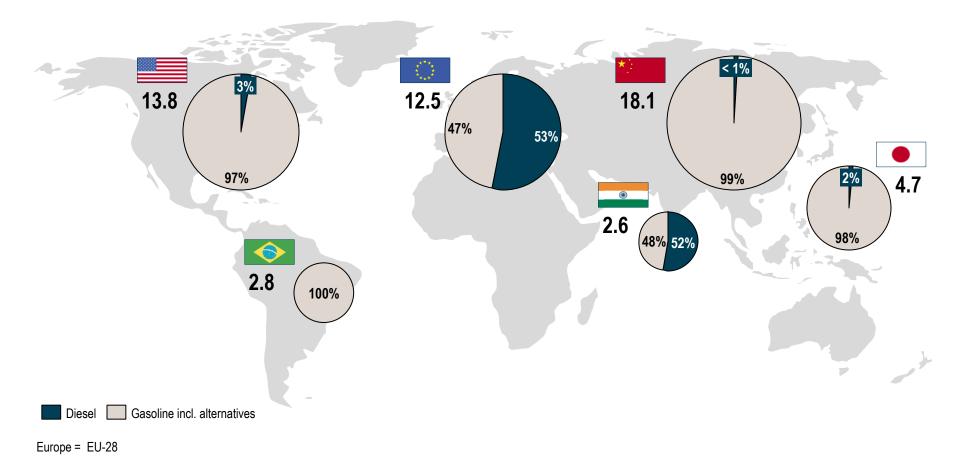

1) Such as homogeneous combustion and HCCI

Berge

Diesel efficiency improvements will be the main lever to reduce fleet emissions for European OEMs to reach 95 g/km target in 2020/2021

EU volume OEM¹⁾ fleet avg. CO₂ emission reduction levers until 2020/2021 [g/km]

¹⁾ Exemplary OEM 2) Including CNG/LPG engine technology improvements

> Regarding reduction of fleet

average CO₂ emissions, diesel

efficiency improvement is a key

lever to reach the target from

the CO₂ emission regulations

> A gap of 12 g/km could not be closed with other powertrain

technologies if diesel were to

> Therefore, the improvement of

diesel efficiency has to be a key pillar of the OEM's CO₂

in 2020/2021

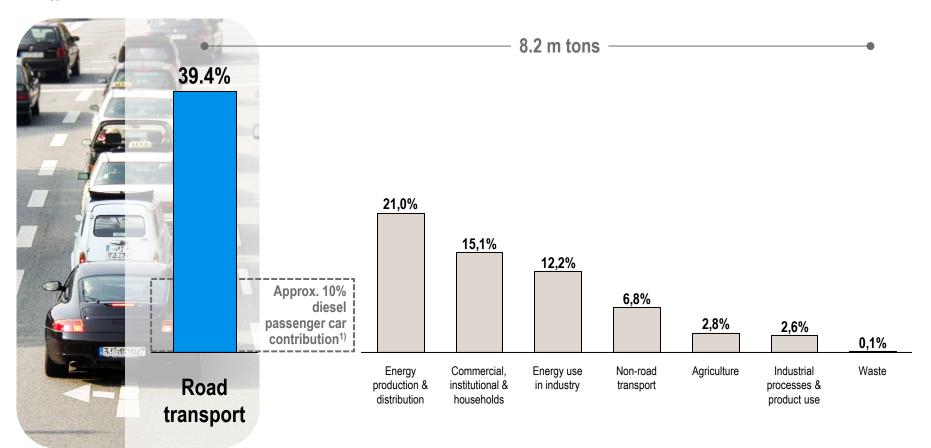

be abandoned

reduction strategy

Berge

As of today, the road transport sector is the largest source of NO_x emissions in Europe – Diesel is a major contributor

NO_x emissions by sector in EU-28, 2013 [%]

1) In Germany, as of 2012

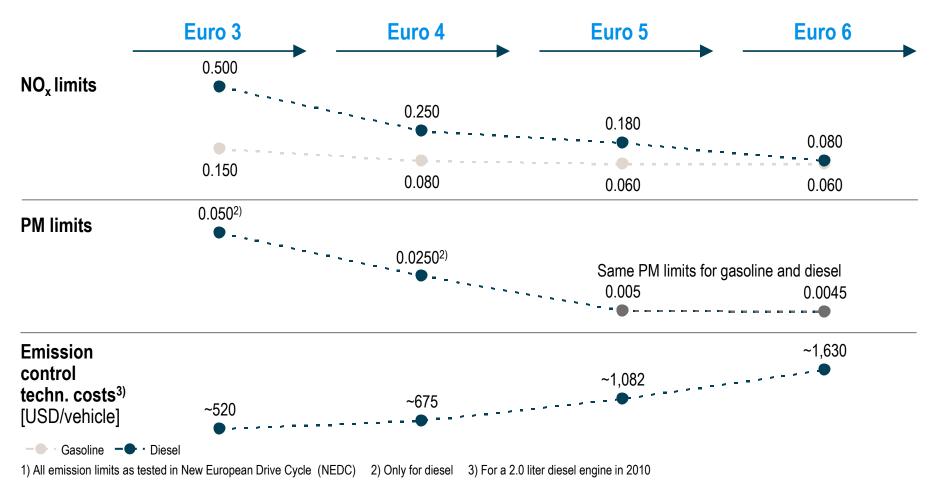

Source: EEA; Bosch; Roland Berger

Berae

The diesel's NO_x and PM limits have approached the level of gasoline but also lead to increases in emission control costs

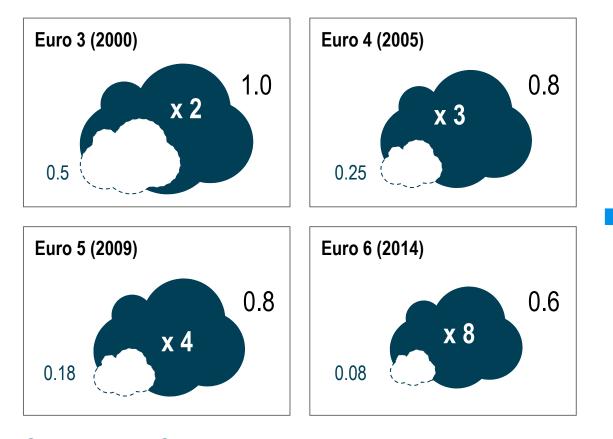

Toxic emission limits¹⁾ of diesel vs. gasoline passenger cars NEDC [g/km]

Nevertheless, the discrepancy between real emissions and EU limits for diesel cars has substantially increased since 2000

NO_x emissions: Diesel passenger cars NEDC [g/km]

- > Reducing the RDE of the diesel powertrain becomes a challenge for OEMs and suppliers
- Manufacturers will need to find solutions for good CO₂ efficiency, low real NO_x emissions and good driving experience

()

Cycle limit

Measured on road

2025 worldwide outlook and drivers for the use of diesel in passenger cars

- Customer interest in diesel in the US market will decline due to the recent controversy; diesel fuel price remains higher than gasoline
- Main local car makers will focus on efficient gasoline engines and electrification
- > Diesel will only be offered in some niche market segments

- > Ban of diesel engine passenger cars in place
- Fierce competition with ethanol/flex fuel (local production)
- > No uptake of diesel engines in passenger cars expected

> European OEMs will still focus on diesel technology due to existing

- investments and CO₂ emission targets
 > Diesel powertrain is getting more expensive, partly due to implementation of RDE cycles with Euro 6c
- > Diesel will lose market share (esp. in smaller vehicle segments)

5

> Chinese government is heavily promoting the development of battery electric vehicles (BEV)

Berae

- Diesel engines will not play any role in China for passenger cars
- > Diesel engines are only relevant for trucks

> Sales of diesel-fuelled cars expected to keep on rising Strong focus of Japanese OEMs in alternative powertrain technologies (i.e. hybrid and electric vehicles)

- > Government subsidies for alternative powertrains
- > No major share of diesel engines in passenger cars expected

Three scenarios on future of diesel possible in Europe 2030 – "Most likely" is decrease of diesel with shift toward upper car segments

Diesel scenarios in Europe/forecast new car diesel shares in EU-28 until 2030¹⁾

"Diesel extinction"		"Focused shift"			"Diesel constant"			
								53%
2015	2020	2030	2015	2020	2030	2015	2020	2030
> Do not trust diesel technology as a "clean" solution any more		 Still trust diesel technology as "clean" TCO will be a strong buying criteria 		 Still trust diesel technology as "clean" Diesel is "technology of choice" 				
 Scrap actual tax incentives for diesel fuel Strong support of alternative powertrains Change regulations against diesel, e.g. ban it from the roads 			 Accept importance of diesel technology for CO₂ reduction in general Increase regulation on Real Driving Emissions Tax changes in some EU member states 			 Support the diesel engine without any restrictions 		
> Does not meet new regulation targets			 Diesel engine becomes more expensive due to additional after-treatment technologies 			> No additional technology needed		
 > Diesel will completely lose all importance by 2030 > OEMs have to shift their powertrain strategy to alternative solutions 			 > Diesel engine will lose market share constantly, esp. in lower car segments > Diesel will still play a major role in upper vehicle segments 			 > Diesel will stay at the same level as today in terms of volume > No change in vehicle segments

Diesel powertrain still expected to hold dominant position in upper passenger car segments despite decline in diesel share by 2030

"Focused shift": New car diesel forecast by segment in EU-28 until 2030¹⁾

Source: EEA; Roland Berger

Diesel essential for CO_2 reduction by OEMs but higher technology demand to meet regulations – Potential benefits for supplier industry

"Focused shift": OEM and supplier implications

OEMs

Accept and close the gap between cycle and Real Driving Emissions of diesel engines

Develop and **implement (after-treatment)** solutions in order to reduce RDE

Adapt powertrain strategy by **shifting the diesel focus** from lower to upper car segments

Accelerate **implementation of alternative powertrain solutions** (electrification) to meet CO₂ regulations

Successfully convince car buyers and policymakers of "The New Clean Diesel"

Innovative so and clean d
 Innovative so gasoline tec
 Higher dema powertrain s for cost-inten
Higher dema solutions for RDE regulati
Shift from di car segments
Long-term v

Suppliers

Innovative solutions for more efficient and clean diesel technologies needed

Innovative solutions for more efficient gasoline technologies needed

Higher **demand for alternative powertrain solutions** increases demand for cost-intensive BEV/PHEV cars

gher **demand for after-treatment plutions** for diesel engines to meet DE regulations

Shift from diesel to gasoline engines in car segments changes the technology

Long-term volume reduction through increasing demand for BEV cars

Roland Berger
